Question

Answer

What are the characteristics of living organisms studied in class 8 science?

Living organisms have characteristics such as growth, reproduction, response to stimuli, metabolism, cellular organization, and adaptation to the environment.

How do plants and animals

differ in their modes of

nutrition?

Plants prepare their own food through photosynthesis

using sunlight, water, and carbon dioxide (autotrophic

nutrition), whereas animals consume other organisms

for food (heterotrophic nutrition).

What is photosynthesis and

why is it important?

Photosynthesis is the process by which green plants use

sunlight to convert carbon dioxide and water into

glucose and oxygen. It is important because it produces

food for plants and oxygen necessary for the survival of

most living organisms.

Explain the structure and

function of a cell membrane.

The cell membrane is a thin, flexible layer surrounding

the cell that controls the movement of substances in

and out of the cell, maintaining homeostasis.

What is the role of

chlorophyll in plants?

Chlorophyll is the green pigment in plants that captures light energy from the sun, which is essential for photosynthesis.

How do unicellular and multicellular organisms

differ?

Unicellular organisms consist of a single cell that performs all life functions, while multicellular organisms have multiple specialized cells performing different functions.

What is the importance of respiration in living organisms?

Respiration is the process by which living organisms break down glucose to release energy required for various life activities.

Describe the process of reproduction in living organisms covered in class 8 science.

Reproduction is the biological process by which living organisms produce offspring. It can be sexual, involving two parents and genetic variation, or asexual, involving a single parent producing identical offspring.
