Sample Questions from the June 2013 Paper and Model Answers

To illustrate the depth and style of questions, here are sample questions with brief explanations:

Question 1: Reaction Mechanism

Describe the mechanism for the nucleophilic substitution of chloroethane with hydroxide ions.

Model Answer:

The mechanism involves a nucleophilic attack by the hydroxide ion on the carbon atom bonded to chlorine. The lone pair on oxygen attacks the carbon, forming a transition state, leading to the displacement of chloride ion. The process proceeds via an S_N2 mechanism, characterized by a single concerted step with inversion of configuration.

Question 2: Spectroscopic Data Interpretation

Given the IR spectrum showing a broad absorption around 3300 cm^{-1} and a strong peak at 1700 cm^{-1} , identify the functional groups present.

Model Answer:

The broad absorption at 3300 cm^{-1} indicates O-H stretching, consistent with alcohols or carboxylic acids. The strong peak at 1700 cm^{-1} suggests C=O stretching, typical of carbonyl groups in aldehydes, ketones, or carboxylic acids. Combined, these features point to a carboxylic acid.
