Sample Questions and Model Answers for FIN 571 Final Exam

To help you prepare, here are some sample questions with detailed answers.

Sample Question 1: Calculating NPV

Question:

A project requires an initial investment of \$100,000. Expected cash inflows are \$30,000 annually for 5 years. The company's cost of capital is 8%. What is the net present value (NPV) of this project?

Answer:

Step 1: Identify the cash flows

- Initial investment: -\$100,000
- Annual cash inflows: \$30,000 for 5 years

Step 2: Calculate the present value of inflows

Using the formula for the present value of an annuity:

$$PV = C \times [(1 - (1 + r)^{-n}) / r]$$

Where:

$$C = \$30,000$$

$$r = 0.08$$

$$n = 5$$

$$PV = 30,000 \times [(1 - (1 + 0.08)^{-5}) / 0.08]$$

$$PV = 30,000 \times [(1 - (1.08)^{-5}) / 0.08]$$

Calculate $(1.08)^{-5}$:

$$(1.08)^{-5} = 1 / (1.08)^5 = 1 / 1.4693 = 0.6806$$

Now, PV:

$$PV = 30,000 \times [(1 - 0.6806) / 0.08]$$

$$PV = 30,000 \times [0.3194 / 0.08]$$

$$PV = 30,000 \times 3.9925 = \$119,775$$

Step 3: Calculate NPV

$$NPV = PV \text{ of inflows} - \text{initial investment}$$

$$NPV = 119,775 - 100,000 = \$19,775$$

Conclusion:

The project has a positive NPV of approximately \$19,775, indicating it is financially viable.

Sample Question 2: Determining Cost of Capital

Question:

A firm has a debt-to-equity ratio of 0.5, with the cost of debt at 5% and the cost of equity at 12%. The corporate tax rate is 21%. What is the weighted average cost of capital (WACC)?

Answer:

Step 1: Calculate weights

- Debt weight (W_d):

$$W_d = D / (D + E)$$

With $D/E = 0.5$, then $D = 0.5E$

$$\text{Total capital} = D + E = 0.5E + E = 1.5E$$

$$W_d = D / (D + E) = 0.5E / 1.5E = 0.5 / 1.5 = 1/3 \approx 0.333$$

- Equity weight (W_e):

$$W_e = 1 - W_d = 2/3 \approx 0.667$$

Step 2: Apply the WACC formula

$$\text{WACC} = (E / V) \times R_e + (D / V) \times R_d \times (1 - T_c)$$

$$\text{WACC} = W_e \times R_e + W_d \times R_d \times (1 - T_c)$$

Plugging in the values:

$$\text{WACC} = 0.667 \times 12\% + 0.333 \times 5\% \times (1 - 0.21)$$

$$\text{WACC} = 0.667 \times 0.12 + 0.333 \times 0.05 \times 0.79$$

$$\text{WACC} = 0.08004 + 0.0132 \approx 0.0932 \text{ or } 9.32\%$$

Conclusion:

The firm's WACC is approximately 9.32%.

Detailed Breakdown of Core Topics

Time Value of Money (TVM)

Understanding the core principle: Money today is worth more than the same amount in the future due to its earning potential.

Key formulas:

- Present Value (PV) = $FV / (1 + r)^n$
- Future Value (FV) = $PV \times (1 + r)^n$
- Annuities and perpetuities calculations

Application tips:

- Use a financial calculator or spreadsheet
- Be aware of different compounding periods (monthly, quarterly, annually)

Capital Budgeting Techniques

NPV (Net Present Value): The sum of discounted cash flows minus initial investment. A positive NPV indicates a profitable project.

IRR (Internal Rate of Return): The discount rate that makes NPV zero. Projects with IRR exceeding the required rate of return are acceptable.

Payback Period: Time needed to recover initial investment.

Decision criteria:

- Prefer projects with the highest NPV
- Use IRR in conjunction with the cost of capital
- Consider payback period for liquidity concerns

Cost of Capital

WACC (Weighted Average Cost of Capital): The average rate a company must pay to finance its assets.

Components:

- Cost of debt
- Cost of equity
- Proportions of debt and equity in capital structure

Formula:

$$\text{WACC} = (E/V) \times Re + (D/V) \times Rd \times (1 - Tc)$$

Application:

- Used as the discount rate in capital budgeting
- Reflects the risk profile of the firm's investments

Risk and Return Analysis

Key concepts:

- Expected return
- Variance and standard deviation
- Risk premiums

Portfolio Theory:

- Diversification reduces risk
- Efficient frontier represents optimal portfolios

Capital Asset Pricing Model (CAPM)

Purpose: To determine the expected return of an asset based on its risk relative to the market.

Formula:

- Expected Return = Risk-Free Rate + Beta × (Market Return - Risk-Free Rate)

Interpretation:

- Beta measures sensitivity to market movements
- Higher beta implies higher risk and higher expected return

Practical Tips for Exam Day

- Read all questions carefully before starting
- Allocate time proportionally to question weight
