Key Topics Covered in Breast Imaging RadCases

- Typical Benign Breast Lesions

Understanding common benign findings is crucial to avoid unnecessary biopsies. RadCases often feature:

- Fibroadenomas: Well-circumscribed, oval or gently lobulated masses on mammography and ultrasound. MRI features include homogeneous enhancement.
- Cysts: Simple cysts show anechoic content with posterior acoustic enhancement on ultrasound; on mammography, they appear as well-circumscribed radiolucent areas.
- Fibrocystic changes: Manifest as subtle architectural distortions or subtle densities, often fluctuating with menstrual cycle.

- Benign but Atypical Lesions

Some benign lesions may mimic malignancy or require follow-up:

- Radial scars: Stellate lesions with radiating scar tissue, sometimes mimicking carcinoma.
- Sclerosing adenosis: Dense tissue that can appear as a suspicious mass.
- Intraductal papillomas: Often presenting with bloody nipple discharge, seen on ductography or

MRI.

- Malignant Breast Lesions

RadCases provides detailed examples of various carcinomas:

- Ductal Carcinoma In Situ (DCIS): Microcalcifications on mammography are hallmark findings; MRI may show non-mass enhancement.
- Invasive Ductal Carcinoma: Irregular, spiculated masses with associated architectural distortion.
- Invasive Lobular Carcinoma: Often subtle, with poorly defined margins; MRI is especially helpful.
- Inflammatory Breast Cancer: Diffuse skin thickening, edema, and mass effects.
- Special Imaging Techniques and Their Roles
 - Digital Mammography & Tomosynthesis: Improved detection of microcalcifications and subtle masses.
 - Breast Ultrasound: Critical for further characterization, guiding biopsies.
 - Breast MRI: Superior for assessing extent, especially in dense breasts or lobular carcinomas.
 - Molecular imaging: Emerging role in staging and therapy response.

Practical Approach to Breast Imaging Cases

Step 1: Gather Clinical Context

- Patient age and history
- Presenting symptoms (lumps, pain, nipple discharge)
- Prior imaging or biopsies

Step 2: Analyze Imaging Features

- Mass characteristics: shape, margins, density, echogenicity
- Calcifications: morphology, distribution
- Architectural distortion: presence and significance
- Skin and nipple changes

Step 3: Differential Diagnosis

Based on imaging, consider:

- Benign processes (e.g., fibroadenoma, cyst)
- High-risk lesions (e.g., atypical ductal hyperplasia)
- Malignant processes

Step 4: Management and Follow-up

- BI-RADS categorization
- Recommendations for biopsy, follow-up, or additional imaging

Step 5: Correlate With Pathology

Question What are the key imaging features of benign versus malignant breast masses on mammography? Benign masses typically appear as well-circumscribed, round or oval lesions with smooth margins and may have calcifications that are coarse or popcorn-like. Malignant masses often present as spiculated or irregular borders, with high density, and may show architectural distortion or microcalcifications with suspicious morphology, such as fine pleomorphic or linear branching patterns. How does breast ultrasound complement mammography in breast imaging? Ultrasound is particularly useful for evaluating palpable findings, differentiating cystic from solid lesions, guiding biopsies, and assessing dense breast tissue where mammography sensitivity is reduced. It provides real-time assessment of lesion characteristics such as shape, margins, and internal echoes, aiding in accurate diagnosis. What are the typical imaging features of ductal carcinoma in situ (DCIS) on mammography? DCIS often presents as microcalcifications with a fine, linear, or branching pattern. These calcifications are usually high-contrast, clustered, and distributed

within the ductal system. Sometimes, associated architectural distortion or a mass may be seen, but microcalcifications are the primary imaging hallmark. In what scenarios is MRI recommended in breast imaging? MRI is recommended for high-risk screening in women with genetic predispositions (e.g., BRCA mutations), evaluating extent of known cancer, assessing response to neoadjuvant therapy, and problem-solving inconclusive findings on mammography or ultrasound. It offers high sensitivity, especially for invasive cancers and multifocal or multicentric disease. What are the common pitfalls or artifacts in breast imaging that can lead to false positives? Common pitfalls include overlapping fibroglandular tissue mimicking a mass, skin folds, motion artifacts, and benign calcifications such as vascular or degenerative types. Proper technique, positioning, and correlation across imaging modalities help reduce false positives. How do radiologists differentiate between benign and malignant microcalcifications? Benign calcifications tend to be coarse, round, and widely spaced, often associated with benign processes like fibroadenomas or calcified ducts. Malignant microcalcifications are usually fine, pleomorphic, or linear/branching, clustered, and suspicious in distribution, raising concern for DCIS or invasive carcinoma. What is the role of digital breast tomosynthesis (DBT) in breast imaging? DBT provides a three-dimensional view of the breast, reducing tissue overlap and improving lesion detection, especially in dense breasts. It enhances sensitivity and specificity over conventional mammography, aiding in the detection and characterization of subtle lesions. What are the typical imaging findings of inflammatory breast carcinoma? Imaging may show diffuse skin thickening, increased breast density, and edema. There can be an underlying mass or diffuse infiltration without a distinct tumor. These features often prompt further evaluation with ultrasound and biopsy to confirm diagnosis. How do 'RadCases' and 'RadCases Plus Q&A' enhance radiology education for breast imaging? RadCases and RadCases Plus Q&A provide a collection of real-world, case-based scenarios with images and detailed explanations, fostering pattern recognition, differential diagnosis skills, and clinical decision-making. They serve as valuable tools for residents and practicing radiologists to stay current with trending imaging features and management strategies.
