2. Development of Male Sterile Lines

Male sterility is a crucial component in hybrid seed production, preventing self-pollination and facilitating controlled cross-pollination. Male sterile lines are developed through genetic or cytoplasmic male sterility systems.

3. Hybridization Process

Controlled pollination occurs by manually transferring pollen from the male parent to the female parent (male sterile line). This process involves:

- Isolation of flowering plants
- Bagging flowers to prevent unwanted pollen contamination
- Hand pollination with selected pollen

4. Seed Harvesting and Processing

Once the hybrid seeds mature, they are carefully harvested to maintain genetic purity. Seeds are cleaned, graded, and stored under optimal conditions to preserve viability.

5. Quality Testing and Certification

Seed samples undergo germination tests, purity analysis, and disease screening. Certified seeds meet national and international standards, ensuring quality for growers.
