Introduction to Optical Fibre Communication

Optical fibre communication is a method of transmitting information from one place to another by sending pulses of light through an optical fibre. Murali Babu?s work emphasizes the advantages of optical fibres over traditional copper wires, including higher bandwidth, lower attenuation, immunity to electromagnetic interference, and increased security.

What is Optical Fibre?

Optical fibre is a thin, flexible strand made primarily of glass or plastic. It comprises:

- **Core:** The central region through which light propagates.
- **Cladding:** The outer optical material surrounding the core, having a lower refractive index to facilitate total internal reflection.
- **Jacket:** The protective outer covering that shields the fibre from physical damage.

Principles of Operation

The fundamental principle behind optical fibre communication is total internal reflection, which allows light to travel through the core with minimal loss:

- Light is injected into the core at one end of the fibre.
- Due to the high refractive index of the core compared to the cladding, the light reflects internally and propagates along the length of the fibre.

- The process enables long-distance data transmission with minimal attenuation and interference.
