The standard covers testing of undisturbed and remolded samples, with specifications for sample size, testing loads, and data recording.

Methodology and Testing Procedures

BS 1377 Part 6 prescribes a systematic approach to perform consolidation tests, primarily using oedometers?rigid cylindrical cells where soil samples are subjected to incremental vertical stresses.

Sample Preparation

- Undisturbed Samples: Extracted carefully to preserve in-situ structure.
- Remolded Samples: Prepared by mixing soil with specified moisture content and compacting to desired density.
- Size and Shape: Usually, samples are cylindrical with diameters of 38 mm or 70 mm, and heights of 20-40 mm, depending on test requirements.
- Saturation: For cohesive soils, samples are saturated before testing to ensure accurate results.

Testing Procedure

- Setup:
 - Place the soil specimen within the oedometer ring.
 - Ensure proper seating and saturation.
- Loading:

- Apply a sequence of incremental vertical stresses.
- Each load is maintained until primary consolidation is complete, indicated by constant deformation rates.

- Data Collection:

- Record vertical deformation and pore pressure (if applicable) at each load step.
- Plot the void ratio against effective stress to create compression curves.

- Unloading and Recompression:

- Some tests include unloading-reloading cycles to determine pre-consolidation pressure.

- Analysis:

- Derive parameters such as compression index (C_c), recompression index (C_r), pre-consolidation pressure (σ'_c), and coefficient of consolidation (c_v).

Key Calculations and Interpretation

- Pre-consolidation Pressure (σ'_c): The maximum past pressure experienced by the soil, identified via the "crossover point" in the compression curve.

- Compression Index (C_c): The slope of the virgin compression line on a semi-logarithmic plot, indicating settlement potential.

- Coefficient of Consolidation (c_v): Derived from the time-settlement data, reflecting how quickly consolidation occurs.
