Hardware

The physical devices involved in processing and storage, such as servers, computers, networking

equipment, and peripherals.

Software

The programs and operating systems that run on hardware, including enterprise applications, databases, and middleware.

Data

The core asset of any information system, consisting of raw facts that are processed into meaningful information.

People

Users and IT personnel who operate, manage, and utilize the system to achieve organizational goals.

Processes

The procedures and rules that govern data collection, processing, and dissemination.

Types of Information Systems

Stephen Doyle categorizes information systems based on their scope and purpose, highlighting their evolving roles within organizations.

Transaction Processing Systems (TPS)

These systems handle daily routine transactions such as sales, payments, and inventory updates. They are essential for maintaining accurate, real-time operational data.

Management Information Systems (MIS)

MIS aggregate data from TPS and other sources to generate reports, summaries, and dashboards that assist middle management in monitoring organizational performance.

Decision Support Systems (DSS)

Designed to aid complex decision-making, DSS analyze large datasets and model scenarios to support strategic decisions.

Enterprise Resource Planning (ERP) Systems

ERP integrates core business processes across departments like finance, HR, manufacturing, and supply chain into a unified system.

Customer Relationship Management (CRM) Systems

CRM tools help manage customer interactions, improve service, and foster customer loyalty.

Business Intelligence (BI) Systems

BI systems analyze data to uncover insights, trends, and patterns that inform strategic planning.

Design Principles for Effective Information Systems

Stephen Doyle emphasizes that thoughtful design is fundamental to creating systems that are reliable, scalable, and aligned with organizational goals. Key principles include:
