QuestionAnswer What are the most common risk factors for coronary artery disease? The most common risk factors include hypertension, hyperlipidemia, smoking, diabetes mellitus, obesity, sedentary lifestyle, family history of cardiovascular disease, and age. How is acute myocardial infarction diagnosed in the emergency setting? Diagnosis is primarily based on clinical presentation, characteristic ECG changes such as ST elevation or new Q waves, and elevated cardiac biomarkers like troponins. What is the role of echocardiography in cardiology? Echocardiography assesses cardiac structure and function, detects valvular abnormalities, evaluates ejection fraction, and guides management of various cardiac conditions. Which medications are commonly used in the management of heart failure? Common medications include ACE inhibitors or ARBs, beta-blockers, diuretics, aldosterone antagonists, and in some cases, vasodilators and inotropes. What are the indications for percutaneous coronary intervention (PCI)? PCI is indicated for acute ST-elevation myocardial infarction (STEMI), non-ST elevation acute coronary syndromes with ongoing ischemia, and significant coronary artery stenosis causing symptoms or ischemia. How does atrial fibrillation increase the risk of stroke? Atrial fibrillation causes ineffective atrial contractions, leading to blood stasis and formation of thrombi in the atria, which can embolize to cerebral arteries causing stroke. What lifestyle modifications are recommended for patients with hypertension? Recommendations include dietary salt restriction, regular physical activity, weight loss, moderation of alcohol intake, smoking cessation, and stress management. What is the significance of a prolonged QT interval on ECG? A prolonged QT interval can predispose to life-threatening arrhythmias like Torsades de Pointes and may be caused by medications, electrolyte imbalances, or congenital syndromes. How is heart failure classified according to the New York Heart Association (NYHA)? NYHA classification ranges from Class I (no symptoms with ordinary activity) to Class IV (symptoms at rest), guiding treatment and prognosis. What are the key differences between stable angina and unstable angina? Stable angina occurs predictably with exertion and resolves with rest, while unstable angina is new, worsening, or occurs at rest, indicating higher risk for myocardial infarction.
